

TinyClaw

Most AI agents are built for one person. TinyClaw is built for teams.

Multi-org · Role-aware · Multi-channel AI infrastructure

github.com/ahmadrosid/tinyclaw

Why TinyClaw exists

Every AI agent looks amazing... until an entire team starts using it.

We kept seeing the same failures:

- Shared memory leaks across teams
- No permission boundaries
- Unsafe collaboration

Agents don't fail because of prompts. They fail because teams lack infrastructure.

Why now

Production AI teams are here. The ops layer isn't.

Year	Shift
2023	AI copilots
2024	AI agents
2025+	Production AI teams

They need: identity · permissions · shared memory · governance

TinyClaw is built for this transition.

Problem

You ship it solo. The business breaks it.

- **Data exposure** — One team accidentally accesses another team's data
- **No governance** — Anyone can change tools and automations
- **Channel fragmentation** — Web, CLI, and chat don't share one agent
- **Production risk** — One wrong automation can stop backups and cron jobs

This isn't an LLM problem. It's an infrastructure problem.

Solution

One AI. Multiple teams. Safely.

- **Organization isolation** — One deploy, many teams, zero cross-leakage
- **Role-based permissions** — Members chat. Admins change automations.
- **Shared memory across channels** — Web, CLI, Telegram, Slack, Discord...
- **Agent identity** — Memory, tools, and persona per profile

Outcome first. Infrastructure second.

Who it's for

Teams already past the single chatbot stage

- **AI agencies** deploying agents for clients
- **Internal AI teams** at product companies
- **Engineering orgs** rolling agents into ops and support
- **Companies** moving agents from demo to production

Live demo · 90 sec

1. **Web** — teach the agent a fact
2. **Telegram** — same agent remembers
3. **Switch org** — clean slate, nothing leaked

Wow: memory crosses channels — same agent, different surface.

Why TinyClaw

Existing AI agents work for individuals. TinyClaw works for organizations.

Need	Most agents	TinyClaw
Multiple teams, one deploy	×	✓
Roles stop dangerous changes	×	✓
Same memory on web + chat	×	✓

Infrastructure for production AI teams — not another chatbot.

Traction

Open source momentum

 38 stars	 8 forks	 5 contributors
--	---	--

- Self-hosted · full monorepo · runnable today
- Web, CLI, Telegram, WhatsApp live
- Growing OSS community

What's next

Business milestones

- Enterprise SSO
- Audit logs
- Hosted cloud
- First design partners
- First paying teams

The ask

Infrastructure for production AI teams

Partners	Agencies & enterprises deploying agents at scale
Adopters	Design partners running TinyClaw in production
Investment	Enterprise features · hosted platform · GTM
